MI Technical Solutions Welcomes High School Students for Two-Week Summer Intern Program

High school interns learn how to build hardware and present a business proposal

Chesapeake, VA, August 7, 2025 - MI Technical Solutions (MITS) is proud to announce another successful year of our summer high school internship program! This summer, six talented students were selected and provided a unique opportunity to gain hands on experience in the fields of technology and business to further their career planning.

Over the course of the two-week program, they participated in various technical and business driven activities. Their first objective was to create 3D hooks (using Computer Aided Design (CAD) within Fusion 360) to be retrieved with our underwater rover. Their second objective was to participate in various lessons and labs centered on cybersecurity software tools used by a cybersecurity professional during a typical day. Next, they learned about our various hardware solutions and even built one from the ground up! Their fourth objective, dealing with software development, was to be introduced to Python and use it to create a simple chatbot, password generator, and a number guesser. The intern's final objective was to plan and present a business development pitch focusing on a product and / or service to current employees. This comprehensive approach for our internship program has allowed local area high school students and our employees to successfully engage in a multifaceted environment of mentorship, technical skill, networking, and professional development.

Our high school summer internship program reflects MITS' commitment to investing in the next generation of leaders. We look forward to hosting next year's summer internship program!
