MI Technical Solutions Equips Client with Emergent Internet Connectivity

San Diego, CA February 27, 2024 – In late January 2024, MI Technical Solutions' (MITS) client experienced catastrophic flooding requiring the eventual evacuation and relocation of their on-site personnel. Their Emergency Management Site Coordinator requested mission critical communication and connectivity assistance for their temporarily relocated personnel in order to continue their job responsibilities.

In less than 10 days, the MITS Team was tasked with and completed the installation of Wireless Connectivity Solutions (WCS), a combination of two services: Wireless Connectivity Bridge (WCB) and Mobile Connectivity Solutions (MCS). This emergent installation provided more than 100 displaced personnel access to commercial internet. With WCS and its speeds of approximately 260 Mbps, users have not only Wi-Fi, but Wi-Fi calling and Wi-Fi connectivity capabilities. An on-site building manager stated, "They greatly appreciate the exceptional assistance that was provided and the quick turnaround time to get the commercial network installed. The personnel are reporting improved internet speeds and network dependability. They no longer must wait for network drops to become available since Wi-Fi is now available anywhere in the building."

WCS' impact for our client in two years continues to demonstrate improved internet access for their facilities and personnel. With an estimated minimal cost of \$6.00 per month per user and the calculated efficiency of over three million man-hours saved, WCS continues to be requested and installed. MITS is honored to support our client's need for WCS for its personnel.
